Asset intensive industries are increasingly focused on accelerating progress toward achieving sustainability goals. At the same time, these essential resource providers are faced with a growing population in need of more resources and a desire for improved standards of living. There is no “one-size-fits-all” approach, and various sustainability pathways are needed to meet sustainability targets. AspenTech provide software tools such as process simulators to help on these pathways, such as energy efficiency, bio-based feedstock conversion, hydrogen economy, carbon capture, plastic recycle. This exhibition will demonstrate features and examples for various sustainability pathways.
